

ForestMap

Theme: Digitalisation of forestry management, inventory and monitoring – Aerial inspection and remote sensing services for forest management

1. About ForestMap

ForestMap is an online platform, developed by Agresta, that calculates forest inventories based on remote sensing technologies such as LiDAR and Sentinel 2. ForestMap offers detailed forest inventory reports and provides information such as the wood stock in a forest plot and other key decision-making data that you can easily request from your computer, at a fraction of the costs of a traditional forest inventory.

2. Potential collaborations

- In countries where ForestMap is available, Agresta is offering the services to forest owners (private or public; of any size), forest managers, timber companies and forestry associations, as potential customers, while seeking collaboration with them to improve the accuracy of ForestMap.
- In countries where ForestMap is not available yet, Agresta is seeking collaboration with forest authorities to share any airborne LiDAR data available in order to adapt and offer ForestMap to the potential users in these countries.
