

# Kelluu

Theme: Digitalisation of forestry management, inventory and monitoring – Aerial inspection and remote sensing services for forest management

## 1. About Kelluu

Kelluu produces small, autopilot airships that can stay in the air (almost) permanently. Kelluu airships are made from the most advanced materials on the market and can be loaded with three kilograms of any modern sensors. Then they continuously move or float in place, collect data and transfer it wherever needed. Airships can fly at different altitudes depending on requirements of the data to be collected. Kelluu provides the continuous aerial inspection or surveillance with their airships as a service. Airships can fly alone or as a coordinated fleet to speed up the scan of the territory.

## 2. Potential collaborations

- Any forestry stakeholder needing extensive coverage of remote sensing data acquisition at low altitude.
- Operators of infrastructures that require extensive or periodic monitoring, such as powerlines or pipelines.
