

LasInfo

Theme: Digitalisation of forestry management, inventory and monitoring – Software for planning forest management

1. About LasInfo

LasInfo is a full-scale management support system for managers of forests and natural resources in various organisational and legal contexts: public, municipal, and private forests, protected areas, such as national parks, experimental forests owned by research institutions, seashore protective forests etc. It is a comprehensive solution which includes a centralised data management module, geographic information system, desktop and mobile device applications, support for all forest management processes and integration of information flow throughout the organisation in various settings. LasInfo is highly customisable: new functionalities can be created under request, including forest management activities not related to silviculture and timber harvesting, such as wildlife management.

2. Potential collaborations

- Taxus IT, developer of LasInfo, is searching partners to expand LasInfo to other geographical areas outside its current market: Poland, adapting LasInfo to the context of new countries and users.
- In addition, Taxus IT hopes to find new potential business partners that would be interested in using LasInfo in their operations.
